FrontDoor: Demo Video Script

Target 2:30, hard limit 3:00. Read the right-hand column aloud. *Italic lines* are spoken into the app during the screen recording; everything else can be recorded as voice-over afterwards.

★ Make sure these land: what makes FrontDoor different

Judges should leave knowing these seven things. Each one has a ★ moment in the script.

1. Matches your condition, not just distance Other apps show the nearest ER or its wait time. FrontDoor checks which ER has the right department, a doctor on call, a free bed and the equipment ready (cath lab, OR, CT) right now.	Scene 3, 4, 6
2. The car gets what an ambulance gets Speak your symptoms, get triaged, and the ER is warned before you arrive with what to prepare. About 4 in 5 ER patients arrive without an ambulance and get none of this today.	Scene 3, 5
3. Safety first: it tells critical patients to call 911 It never tells a critical patient to keep driving; mental-health crises get 988. Never shows a diagnosis.	Scene 5
4. Real ambulances on the same board Paramedics speak the report, vitals pre-fill from what they said, and the hospital replies out loud ("Bed held for your patient"). The closest ER is skipped if it can't treat the patient.	Scene 6
5. An AI agent that acts, with a human in charge The Charge-Nurse Assistant pages the right team and holds a bed in seconds. Anything big waits for a nurse's Approve, and it has no way to lower urgency or discharge anyone.	Scene 7
6. Nobody waits unwatched Voice check-ins every 2 minutes in 5 languages plus vitals; if someone gets worse, a nurse is alerted.	Scene 8
7. Measured, real data Claude's triage caught 96% of high-risk patients vs. real ER nurses (MIMIC-IV-ED). Hospital data from California CDPH and HCAI. Everything runs live on SpacetimeDB, voice by Cartesia.	Scene 10

Before you hit record

- Open two windows side by side: the **nurse board** (left, wide) and the **phone or ambulance** screen (right; Chrome F12 → phone icon). Use the menu bar at the top to switch.
- Press **Reset demo** on the board before every take, and tell the team so nobody else is testing on the shared database while you record.
- Zoom the browser to about 110%. Quiet room, headset mic (the app really transcribes what you say).
- Do one practice run first: the first AI and voice calls after startup are slower.

The script

0:00
1. Hook

ON SCREEN Your face, or the phone screen.

Your dad has crushing chest pain. You grab the keys. Now what? Which ER? Is it full? Does it even have a cardiologist tonight? An ambulance crew would know, and they'd warn the hospital ahead of time. You're just driving and hoping.

0:15
2. Location first

ON SCREEN Phone: "ERs near you" list.

FrontDoor turns your car into an ambulance. The moment you open it, it finds you and shows the ERs around you, with real drive times and waits.

0:25
3. Speak your symptoms

ON SCREEN Tap the mic and say: *"Pain in my lower right belly for eight hours, getting sharper."* Then show the Options card.

★ HIGHLIGHT: Matches your condition, not just distance. Slow down and stress the bold words.

You just talk, in English, Spanish, Chinese, Vietnamese or Tagalog. Claude triages you the way a nurse would, then checks every ER nearby. **Not just who's closest, but who can actually treat you right now:** the right department, a doctor on call, a free bed, the equipment ready.

0:50
4. A better match

ON SCREEN Better-match offer for Kaiser, then tap **Go to Kaiser**.

Our ER's operating room is busy, so it offers Kaiser: surgery ready, ten minutes away. The choice is yours.

1:05
5. Critical? Call 911

ON SCREEN New check-in. Tap the mic and say: *"Crushing chest pain going down my left arm."* Show the red Call 911 card, then the board tile.

★ HIGHLIGHT: Safety first + the ER is warned ahead. Slow down and stress the bold words.

If it's critical, FrontDoor tells you to call 911, never to keep driving. And the ER already knows who's coming and what to prepare: ECG, cardiac monitor.

1:25
6. Real ambulances

ON SCREEN Ambulance screen. Tap the mic and say: *"64 male, crushing chest pain, ST elevation on the 12-lead, BP 150 over 90."* Vitals pre-fill, tap **Pre-notify**, the board lights up, the tablet speaks.

★ HIGHLIGHT: Same board for cars and ambulances. Slow down and stress the bold words.

It works for real ambulances too. The paramedic speaks the report, the vitals go ahead, and **the closest ER gets skipped because its cath lab is busy.** The hospital answers back, out loud, so the crew never looks away from the patient.

1:50 **7. The AI assistant**	ON SCREEN Board: the Charge-Nurse Assistant panel, then tap **Approve** on a suggestion. **★ HIGHLIGHT: AI that acts, human approves. Slow down and stress the bold words.** Our AI assistant handles the first steps in seconds: it pages cardiology, holds a bed and posts a checklist. **Anything big waits for a nurse to approve it.**
2:05 **8. Nobody waits unwatched**	ON SCREEN Phone: **Simulate drive**, arrives. Board: **Worsen**, red alert, **I'm on it**. Phone: "Nurse is coming to you now." **★ HIGHLIGHT: Nobody waits unwatched. Slow down and stress the bold words.** Once you're inside, nobody waits unwatched. FrontDoor checks on you by voice every two minutes. If you get worse, a nurse taps "I'm on it", and your phone tells you help is coming.
2:20 **9. Family**	ON SCREEN Phone: **Share with family**, then the family page with the live map. And your family can see where you are, but never your medical details.
2:30 **10. Close**	ON SCREEN End card: FrontDoor · Claude · Cartesia · SpacetimeDB · 96% high-risk sensitivity. **★ HIGHLIGHT: Measured against real nurses. Slow down and stress the bold words.** **We tested our triage against real ER nurses: it caught 96 percent of high-risk patients.** Hospital data comes from California's public records, and everything you saw ran live. Ambulances already get the right ER and a hospital that's ready. FrontDoor gives that to everyone else. **FrontDoor. Ready before you arrive.**

Editing and upload

- Trim the 3–5 second pauses while the AI is thinking, but keep one full spoken reply so judges hear the voice.
- At least once, keep the board and the phone in the same frame when something changes: that shows it's live.
- Running long? Cut scene 9 (family) first, then scene 8. Never cut scenes 3, 5, 6 or 7.
- Upload to YouTube as **Unlisted** (not Private) and send the link to whoever fills in Devpost.
